## 1.0 INTRODUCTION

The Tetra Tech, Inc. (Tetra Tech) Superfund Technical Assessment and Response Team (START) was tasked by the U.S. Environmental Protection Agency (EPA) Region 7 Superfund Division to assist with a Pre-Comprehensive Environmental Response, Compensation, and Liability Information System (Pre-CERCLIS) Screening at the Bridgeton Municipal Athletic Complex (BMAC) in Bridgeton, Missouri. The Pre-CERCLIS Screening was conducted to evaluate whether further Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) assessment would be warranted. The screening was in response to a request by the Missouri Attorney General to the EPA Regional Administrator after a community group reported detections of elevated radiation readings at BMAC.

Tetra Tech's tasks included, but were not limited to: (1) acquisition of real-time gross gamma measurements of exterior surfaces at BMAC and reference areas, (2) assessment of gross gamma survey results to help select sampling locations, (3) collection of discrete and composite soil samples from BMAC and reference areas for laboratory analysis, (4) collection of discrete soil samples from BMAC for laboratory analysis collocated with samples collected by the community group, (5) completion of a Pre-CERCLIS Screening Form, and (6) documentation of site activities. This final Pre-CERCLIS screening report addresses soil sampling and analytical data, along with a review of all site activities. The gross-gamma survey was detailed in the Preliminary Pre-CERCLIS Screening report dated June 25, 2014.

Colin Willits was the START project manager for the investigation, and the EPA Region 7 On-Scene Coordinator (OSC) was Todd Campbell.

## 2.0 SITE LOCATION AND BACKGROUND

Section 2.0 provides information on the site location and description, and site background.

### 2.1 SITE LOCATION AND DESCRIPTION

The BMAC site is at 13161 Taussig Road in Bridgeton, Missouri. The Global Positioning System (GPS) coordinates of the approximate center of the site are 38.779422 degrees north latitude and 90.428224 degrees west longitude. The site encompasses approximately 70 acres, including 11 baseball fields, four tennis courts, a playground area, a handball/racquetball court, a soccer field, multiple walking trails, two large parking lots, multiple concession buildings, an operation center, and other various structures (see Appendix A, Figures 1 and 2).

Two parks, Koch and Blanchette, were selected to acquire reference data during the Pre-CERCLIS Screening. These parks were selected as reference areas because they contain surface types similar to those at BMAC (including baseball fields with grass-covered and exposed soil areas). Koch Park is 4.1 miles northeast of BMAC near the intersection of Charbonier and Howdershell Roads in Florissant, Missouri. The park encompasses 70 acres and includes several baseball fields. Blanchette Park is 3.3 miles west-northwest of BMAC at 1900 West Randolph Road in St. Charles, Missouri. The park encompasses 44 acres, including several baseball fields (see Appendix A, Figure 1). The two reference areas provide contrasting positions from BMAC relative to prevailing wind directions—that is, Koch Park is generally cross- to downwind of BMAC, and Blanchette Park is generally upwind of BMAC, given the predominant prevailing winds in the area out of the south and west.

## **2.2 PRESENT OWNERS**

BMAC is owned and operated by the City of Bridgeton, Missouri.

## **2.3 SITE HISTORY**

BMAC opened in 1974, encompassing 30 acres including six baseball fields, four tennis courts, four racquetball courts, a concessions building, a pavilion, and an operations storage facility. During the mid-1980s, four batting cages were installed on the south side of the complex. The batting cages were removed in 2007. In 1999, the City of Bridgeton began a phased expansion of BMAC. The 10-year expansion project added five baseball fields (2001 to 2003), a new park maintenance facility (2002), expanded north parking lot (2003 to 2004), one additional concession building (2004 to 2005), one soccer field (2005), one comfort station (2007), a 2-mile walking trail (2008), a playground (2008), and an office and entry building (2009). During construction of the baseball and soccer fields, more than 990,000 cubic feet ( $\text{ft}^3$ ) of soil was brought onto the complex. Soil was acquired from and transported by Noll Construction. The baseball infields were built with a 60/40 mix of sand/silt and clay to conform with University of Missouri recommendations. The outfields were topped with an 80/20 mix of sand and peat, received from the St. Charles Sand Company. In 2012, two infields (Fields 8 and 11) were amended with mined “Granitestone” aggregate from Ironton, Missouri.

Stormwater exits the complex via a combination of storm drains, one detention pond, and surrounding retention swales (Bell 2014).

## **2.4 CURRENT LAND USE**

BMAC currently encompasses approximately 70 acres, including 11 baseball fields, four tennis courts, a playground area, a handball/racquetball court, a soccer field, multiple walking trails, two large parking lots, multiple concession buildings, an operation center, and other various structures.

## **2.5 STRUCTURES AT SITE**

Structures at BMAC include concession stands, restrooms, a park operation center, and an operations storage facility. The nearest residence is 0.36 mile southwest of the park (Google Earth 2014).

## **2.6 PAST ACTIONS**

No previous investigations have occurred at the BMAC site.

## **2.7 GEOLOGY**

The U.S. Geological Survey (USGS) 7.5-minute topographic map depicting the site and general vicinity was obtained and reviewed. The general location of the site is shown on the 1994 USGS St. Charles, Missouri quadrangle map (USGS 1994). The St. Charles quadrangle includes part of the Missouri River floodplain and loess-covered uplands. The floodplain is up to 5 miles wide in this area. The quadrangle lies within the Dissected Till Plains Section of the Central Lowland Province of the Interior Plains Physiographic Division. The St. Charles quadrangle is underlain by Paleozoic limestone and shale. The majority of the quadrangle is underlain by the Mississippian-age St. Louis, Salem, and Warsaw Formations. The site is near a boundary of Quaternary silt-capped alluvium and Quaternary terrace deposit. The Quaternary Silt-Capped Alluvium is primarily composed of clay and variable amounts of silt and organic material in the upper 15 feet. The Quaternary Terrace Deposit consists mainly of organic clays (MDNR 2011).

## **3.0 PRE-CERCLIS SCREENING ACTIVITES**

Field activities for the Pre-CERCLIS Screening were conducted May 19 to 23, 2014. Field activities included (1) acquisition of real-time gross gamma measurements of exterior surfaces at BMAC and reference areas, (2) assessment of gross gamma survey results to help select sampling locations, (3) collection of discrete and composite soil samples from BMAC and reference areas for laboratory analysis, (4) collection of discrete soil samples for laboratory analysis collocated with samples previously collected by the community group, and (5) documentation of site activities. START team members

included Colin Willits, Danny O'Connor, and Tom Binz. EPA personnel included Region 7 OSCs Todd Campbell and Tom Mahler and Region 5 personnel Brian Cooper and Jim Mitchell. Photographic documentation of field activities is in Appendix B. START documented field activities in the site logbook (see Appendix C).

### **3.1 SURFACE SOIL GAMMA SURVEY**

From May 20 to 22, 2014, EPA and START field personnel conducted a survey of gross gamma activity over exterior areas of BMAC. In addition, two reference areas were surveyed from May 19 to 21, 2014, to provide comparative data (Koch Park and Blanchette Park). The survey data were generated using a Ludlum Model 2221 ratemeter with a Ludlum Model 44-20 sodium iodide (NaI) scintillation detector, coupled with a GPS unit and notebook computer running Field Analysis and Sampling Tool (FAST) software. FAST is a software program developed by the EPA Region 5 Field Environmental Decision Support (FIELDS) Team that integrates real-time data from GPS receivers and environmental monitoring instruments. FAST stores the measurement data with their GPS locations in a file and plots the results in a dynamic, two-dimensional display in real time. To ensure proper functioning of radiation detection instrumentation, a twice-daily (prior to and after field work) source check was performed by use of a cesium-137 check source. No abnormal variations in detector readings, indicating an instrument “drifting” out of calibration, were documented. Daily source check and instrument calibration records are in Appendix D.

The gross gamma survey of exterior surfaces at BMAC included collection of 58,716 data points across three surface types (grass-covered areas, exposed soil areas, and improved surfaces). No survey data acquired within BMAC were above twice the background mean, a level at which EPA Region 7 typically conducts further investigation. In addition, geographic plots of the data reveal natural differences in gamma activity exhibited by different soil types or surface materials. No unusual patterns of concentrated discrete areas of elevated gross gamma activity were observed. The gross gamma survey is detailed further in the Preliminary Pre-CERCLIS Screening Report dated June 25, 2014 (Tetra Tech 2014).

### **3.2 SOIL SAMPLING ACTIVITIES**

After the survey of gross gamma activity over exterior areas of BMAC and reference areas, surface soil samples were collected to quantify both gamma emitting and non-gamma emitting radionuclides. Soil sampling locations were chosen to best represent soil type variability and geographic coverage of the site because review of survey data indicated no unusual patterns of concentrated discrete areas of elevated gross gamma activity. Geographic information system (GIS) personnel used GIS software to designate

10 foot by 10 foot Decision Units (DU) across the site. The GIS software was uploaded to a hand-held digital device for field use. Field crews utilized the digital device along with flags and stakes to delineate DUs. From May 21 to 23, 2014, EPA and START personnel collected 112 soil samples. Eighty-eight surface soil samples (0 to 2 inches below ground surface [bgs]) were collected at BMAC. The samples included the following: 30 composite samples collected within grass-covered areas, 30 composite samples collected within exposed soil areas, 17 discrete samples collected within drainage areas, and 11 discrete samples collocated with samples previously collected by the community group (see Appendix A, Figure 3). Twenty-four samples were collected within the two reference areas: Koch Park and Blanchette Park (see Appendix A, Figure 4).

Composite soil samples consisted of five-aliquots of approximate equal mass collected from points distributed evenly over the DU. Samples were collected from 0 to 2 inches bgs using a disposable steel spoon or decontaminated hand-held trowel. Discrete soil samples were single aliquot samples collected from 0 to 2 inches bgs with a disposable steel spoon or decontaminated hand-held trowel. Samples were transferred to labeled sealable plastic bags and placed in coolers for transportation to the laboratory.

Soil samples were submitted for analysis to TestAmerica Laboratories, Inc. (TestAmerica), in Earth City, Missouri. Soil samples were analyzed for isotopic uranium, isotopic thorium, radium-226, and other naturally occurring radionuclides (see Table 1).

#### 4.0 ANALYTICAL DATA SUMMARY

During Pre-CERCLIS Screening activities, 112 soil samples were collected from BMAC and reference areas. Soil samples were submitted for analysis to TestAmerica on May 22 and 23, 2014 (see Table 1). The analytical data package and corresponding chain-of-custody documents are in Appendix E. After the analytical data package had been received, a Tetra Tech chemist completed a data validation report in accord with the EPA Region 7 documents titled “Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review” (EPA 2010) and Chapter 8 of “Multi-Agency Radiological Laboratory Analytical Procedures Manual” (MARLAP), 402-B-04-001A (EPA 2004). In addition, the Tetra Tech document “Review of Data Packages from Subcontracted Laboratories” (Tetra Tech EM, Inc. [Tetra Tech EMI] 2002) was used along with other criteria specified in the applicable methods. The data validation report concluded overall data quality is acceptable, with no unusual qualifications added. All data are usable as qualified for their intended purposes (see Appendix F).

Uranium-238, thorium-230, and radium-226 have been identified as constituents of potential concern (COPC) for the BMAC site, as they have been identified as contaminants at Formerly Utilized Sites Remedial Action Program (FUSRAP) sites in the St. Louis, Missouri, area. In addition, the community group expressed concern with lead-210 at BMAC (lead-210 is a daughter product of radium-226).

Twenty-four soil samples were collected at two reference areas (Koch and Blanchette Park) to quantify naturally occurring radioactive material (NORM) concentrations in the site vicinity. NORM were incorporated into the Earth during its formation and are still present. Rocks, soil, water, air, plants, and animal life all have varying degrees of NORM (U.S. Nuclear Regulatory Commission [NRC] 1994). Using ProUCL Version 5.0.00, reference area analytical data for the COPCs were used to calculate upper simultaneous limits (USL) to estimate background threshold values (BTV) to be used in site versus background evaluations. ProUCL is an EPA-funded and peer-reviewed software used for various basic statistical analyses, including BTVs (EPA 2013). Reference area analytical data reported with the qualifier “U”, analyte not detected above the reported sample quantitation limit, were not used in the calculation of BTVs. A background data set of less than six is not large enough to characterize background population or to perform background versus site comparison (EPA 2013). Very few detectable values were reported from reference area analytical data for lead-210; therefore, the calculated BTV may not represent meaningful or reliable statistics. Radionuclide concentrations in excess of their BTV are compared with the selected risk-based standards to determine if further data review or investigation is warranted. BTV calculation spreadsheets are included in Appendix G. A summary of reference area analytical data and BTVs is listed in Table 2.

NORM	Naturally Occurring Radioactive Material	Th-230 Thorium-230

Ra-226	Radium-226	

The reported radionuclide concentrations for the uranium-238 series from the Koch and Blanchette Park reference areas were consistent with these studies, indicating the reference area analytical data are representative of NORM for the general site vicinity.

Two risk-based standards were used for comparison to BMAC analytical data: the EPA total exposure preliminary remediation goals (PRG) for radionuclides in residential soil at a 1 in 10,000 upper bound lifetime cancer risk to an individual, and the FUSRAP remediation goals (RG). Selection of the 1 in 10,000 upper bound lifetime cancer risk to an individual accords with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), listed in 40 *Code of Federal Regulations* (CFR) Part 300.430 (EPA 1990). The total soil PRGs account for risk from each of the four pathways considered in the PRGs: ingestion, inhalation, external exposure, and produce ingestion pathways. PRGs are generated with standard exposure route equations using EPA slope factors (SF) and exposure parameters. The calculation of the residential soil PRGs take into account the following exposure parameters: (1) 30 years of total exposure, (2) 350 days per year of exposure, and (3) 24 hours per day of exposure (EPA 2014). These assumptions do not likely represent true exposure risk for park visitors but were chosen due to their conservative nature. In instances where isotopes within a decay series were determined to be in secular equilibrium, the “+D” PRG (such as for Ra-226+D) was selected for comparison to the site data. Although it may not be possible to discern from analytical data when isotopes within a decay chain are in true secular equilibrium, for the purposes of this assessment the “+D” PRG risk-based standards were used when available for comparative purposes due to their conservative nature. The “+D” PRGs include the contributions from the parent isotope and its short-lived decay products, assuming equal activity concentrations (secular equilibrium) with the parent nuclide in the environment (EPA 2014). The FUSRAP RGs for the North St. Louis County sites were developed consistent with protective applicable or relevant and appropriate requirements (ARAR) (U.S. Army Corps of Engineers [USACE] 2005). Table 4 summarizes analytical data from BMAC along with comparing the highest value from each isotope, minus the mean reference area value, to risk-based standards. Analytical data are presented in tabular form in Appendix H.

A summary of data for COPCs and lead-210 follows:

Detectable uranium-238 concentrations from alpha spectrometry analysis in BMAC samples range from 0.0862 to 1.74 pCi/g. Using reference area analytical data, a BTV of 0.915 pCi/g was calculated for uranium-238 (alpha spectrometry). The uranium-238 concentration (alpha spectrometry) in five samples collected from BMAC exceeded the BTV. The five samples are therefore compared with their applicable risk-based standards. To begin, the uranium-238 reference area mean (alpha spectrometry) was subtracted from results for the samples exceeding the BTV to eliminate NORM. The remaining values were then compared with the PRG +D (69.6 pCi/g) and the FUSRAP RG (50 pCi/g). None of the values exceeded the PRG or FUSRAP RG. Uranium-238 was also reported with gamma spectrometry analysis;

although this data is considered less accurate as it does not represent a direct measurement of the isotope. No uranium-238 concentrations reported from gamma spectrometry analysis exceeded the PRG or FUSRAP RG.

Detectable thorium-230 concentrations in BMAC samples range from 0.441 to 1.77 pCi/g. Using reference area analytical data, a BTV of 1.35 pCi/g was calculated for thorium-230. The thorium-230 concentration in five samples collected from BMAC exceeded the BTV. The five samples are therefore compared with their applicable risk-based standards. To begin, the thorium-230 reference area mean was subtracted from the results for the five samples to eliminate NORM. The remaining values were then compared with the PRG (346 pCi/g) and the FUSRAP RG (14 pCi/g). None of the values exceeded the PRG or FUSRAP RG.

Detectable radium-226 concentrations in BMAC samples range from 0.458 to 1.71 pCi/g. Using reference area analytical data, a BTV of 1.69 pCi/g was calculated for radium-226. The radium-226 concentration in one sample collected from BMAC exceeded the BTV. The sample was therefore compared with the applicable risk-based standards. To begin, the radium-226 reference area mean was subtracted from the result for the sample to eliminate NORM. The remaining value was then compared with the PRG +D (1.21 pCi/g) and the FUSRAP RG (5 pCi/g). Although it may not be possible to discern if the uranium-238 decay chain (including daughter product radium-226) is in true secular equilibrium, for the purposes of this assessment the PRG +D risk-based standard was determined to be the more applicable comparative standard due to its conservative nature. The sample value did not exceed the PRG +D or FUSRAP RG.

Detectable lead-210 concentrations in BMAC samples range from 1.68 to 9.45 pCi/g. Reference area analytical data reported few detectable concentrations of lead-210; therefore, insufficient data was available to calculate a meaningful BTV. For this reason, lead-210 was compared directly to the PRG. No reported lead-210 data from BMAC samples exceeded the PRG (No FUSRAP RG is established for lead-210).

The BMAC Pre-CERCLIS Screening focused on COPCs identified as contaminants at nearby FUSRAP sites; however, many other radionuclides were reported with laboratory analysis. No significant concentrations were identified during the review of other reported radionuclide.

## 5.0 PATHWAY EVALUATION

### 5.1 GROUNDWATER MIGRATION PATHWAY

According to the USGS Groundwater Atlas of the United States, the site and nearby areas of St. Louis County are within the Mississippian aquifer. The Mississippian aquifer is in carbonate rocks stratigraphically equivalent to those composing the nearby Ozark Plateaus aquifer system (USGS 2014).

Groundwater sampling was not included with the Pre-CERCLIS Screening. However, a release to groundwater is unlikely because no significant surface soil findings resulted from the Pre-CERCLIS Screening.

### 5.2 SURFACE WATER MIGRATION PATHWAY

Review of the St. Charles, Missouri, quadrangle topographic map indicates site runoff is northwest, following the general site topographic gradient toward the Missouri River. According to the U.S. Fish and Wildlife Service (FWS) National Wetlands Inventory (NWI) System, no wetlands are present on the BMAC site (U.S. FWS 2014a). A surface water retention pond is visible near Prouhet Farm Road and was confirmed during site activities. Cowmire Creek is 0.16 mile east of BMAC. The Missouri River is 2.15 miles northwest of BMAC (Google Earth 2014).

Surface water sampling was not included with the Pre-CERCLIS Screening. However, a release to surface water is unlikely because no significant surface soil findings resulted from the Pre-CERCLIS Screening.

### 5.3 SOIL EXPOSURE PATHWAY

Soil assessment during the Pre-CERCLIS Screening included: (1) acquisition of real-time gross gamma measurements of exterior surfaces at BMAC and reference areas, (2) assessment of gross gamma survey results to help select sampling locations, (3) collection of discrete and composite soil samples from BMAC and reference areas for laboratory analysis, and (4) collection of discrete soil samples for laboratory analysis collocated with samples collected by the community group.

No gross gamma survey data acquired within BMAC were above twice the reference area mean, a level at which EPA Region 7 typically conducts further investigation. In addition, no unusual patterns of concentrated discrete areas of elevated gross gamma activity were observed. BMAC soil sample data

were compared to applicable risk-based standards. No radionuclide concentrations were reported above the risk-based standards plus background.

A release to soil is unlikely because there were no significant findings during the gross gamma survey or analytical data comparison.

#### **5.4 AIR MIGRATION PATHWAY**

Air sampling was not included with the Pre-CERCLIS Screening. A release to air is unlikely because no significant surface soil findings resulted from the Pre-CERCLIS Screening.

#### **5.5 OBVIOUS POTENTIAL HUMAN AND ECOLOGICAL RECEPTORS**

Facility users include on-site workers (park maintenance crew) and park visitors. No release has been identified at the BMAC site; therefore, there does not appear to be a potential threat to receptors. The BMAC Pre-CERCLIS Screening Form is in Appendix I.

## 6.0 SUMMARY AND CONCLUSIONS

### 6.1 PRE-REMEDIAL CONSIDERATIONS

The Pre-CERCLIS Screening did not indicate a release of radionuclides to surface soil. No potential exposure risk to humans or endangered or threatened species was identified during assessment activities. Further CERCLA assessment is not warranted at BMAC.

### 6.2 CONCLUSIONS

Pre-CERLCIS Screening activities at the BMAC site were conducted May 19 to 23, 2014. The objectives of the screening were to: (1) acquire real-time gross gamma measurements of exterior surfaces at BMAC and reference areas, (2) assess gross gamma survey results to help select sampling locations, (3) collect discrete and composite soil samples from BMAC and reference areas for laboratory analysis, (4) collect discrete soil samples from BMAC for laboratory analysis collocated with samples collected by the community group, (5) complete a Pre-CERCLIS Screening Form, and (6) document site activities.

The gross gamma survey of exterior surfaces at BMAC included collection of 58,716 data points across three surface types (grass-covered areas, exposed soil areas, and improved surfaces). No survey data acquired within BMAC were above twice the reference area mean, a level at which EPA Region 7 typically conducts further investigation. In addition, geographic plots of the data reveal natural differences in gamma activity exhibited by different soil types or surface materials. No unusual patterns of concentrated discrete areas of elevated gross gamma activity were observed.

After the gross gamma survey had been completed, soil samples were collected to quantify both gamma emitting and non-gamma emitting radionuclides. Soil sampling locations were chosen to best represent soil type variability and site coverage because review of survey data indicated no unusual patterns of concentrated discrete areas of elevated gross gamma activity. Soil samples were analyzed for isotopic uranium, isotopic thorium, radium-226, and other naturally occurring radionuclides. Uranium-238, thorium-230, and radium-226 have been identified as COPCs for the BMAC site, as they have been identified as contaminants at FUSRAP sites in the St. Louis, Missouri area. In addition, the community group expressed concern with lead-210 at BMAC. Analytical data were compared with the total exposure PRGs for radionuclides in residential soil at a 1 in 10,000 upper bound lifetime cancer risk to an individual. Using ProUCL Version 5.0.00, reference area analytical data for the COPCs were used to calculate USLs to estimate BTVs to be used in site versus background evaluations. Radionuclide

concentrations in excess of their BTV were compared with the selected risk-based standards to determine if further data review or investigation was warranted.

A summary of data for COPCs and lead-210 follows:

Detectable uranium-238 concentrations from alpha spectrometry analysis in BMAC samples range from 0.0862 to 1.74 pCi/g. Using reference area analytical data, a BTV of 0.915 pCi/g was calculated for uranium-238 (alpha spectrometry). The uranium-238 concentration (alpha spectrometry) in five samples collected from BMAC exceeded the BTV. The five samples are therefore compared with their applicable risk-based standards. To begin, the uranium-238 reference area mean (alpha spectrometry) was subtracted from results for the samples exceeding the BTV to eliminate NORM. The remaining values were then compared with the PRG +D (69.6 pCi/g) and the FUSRAP RG (50 pCi/g). None of the values exceeded the PRG or FUSRAP RG. Uranium-238 was also reported with gamma spectrometry analysis; although this data is considered less accurate as it does not represent a direct measurement of the isotope. No uranium-238 concentrations reported from gamma spectrometry analysis exceeded the PRG or FUSRAP RG.

Detectable thorium-230 concentrations in BMAC samples range from 0.441 to 1.77 pCi/g. Using reference area analytical data, a BTV of 1.35 pCi/g was calculated for thorium-230. The thorium-230 concentration in five samples collected from BMAC exceeded the BTV. The five samples are therefore compared with their applicable risk-based standards. To begin, the thorium-230 reference area mean was subtracted from the results for the five samples to eliminate NORM. The remaining values were then compared with the PRG (346 pCi/g) and the FUSRAP RG (14 pCi/g). None of the values exceeded the PRG or FUSRAP RG.

Detectable radium-226 concentrations in BMAC samples range from 0.458 to 1.71 pCi/g. Using reference area analytical data, a BTV of 1.69 pCi/g was calculated for radium-226. The radium-226 concentration in one sample collected from BMAC exceeded the BTV. The sample was therefore compared with the applicable risk-based standards. To begin, the radium-226 reference area mean was subtracted from the result for the sample to eliminate NORM. The remaining value was then compared with the PRG +D (1.21 pCi/g) and the FUSRAP RG (5 pCi/g). Although it may not be possible to discern if the uranium-238 decay chain (including daughter product radium-226) is in true secular equilibrium, for the purposes of this assessment the PRG +D risk-based standard was determined to be the more applicable comparative standard due to its conservative nature. The sample value did not exceed the PRG +D or FUSRAP RG.

Detectable lead-210 concentrations in BMAC samples range from 1.68 to 9.45 pCi/g. Reference area analytical data reported few detectable concentrations of lead-210; therefore, insufficient data was available to calculate a meaningful BTV. For this reason, lead-210 was compared directly to the PRG. No reported lead-210 data from BMAC samples exceeded the PRG (No FUSRAP RG is established for lead-210).

The BMAC Pre-CERCLIS Screening focused on COPCs identified as contaminants at nearby FUSRAP sites; however, many other radionuclides were reported with laboratory analysis. No significant concentrations were identified during the review of other reported radionuclide. Results from the Pre-CERCLIS Screening do not indicate need for further CERCLA assessment at the BMAC site.

### CASE NARRATIVE

**Client: Tetra Tech EM Inc.**

**Project: Bridgeton Municipal Athletic Complex**

**Report Number: 160-6793-1**

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica St. Louis attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

The samples were dried on 05/23/2014 and 05/27/2014, prepared on 05/28/2014 and 05/29/2014 and analyzed on 06/19/2014 and 06/20/2014.

Lead-214 analyzed by gamma spectroscopy was detected above the MDA in the blank. Variations in Compton backgrounds and statistical analyses allowed for small area counts in the ROIs of this nuclide. Other Thorium decay chain products are not present in the blank to support Lead 214 identification. The data is reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

The data were qualified according to the U.S. Environmental Protection Agency (EPA) Region 7 documents entitled "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review" (9240.1-51, January 2010) and Chapter 8 of "Multi-Agency Radiological Laboratory Analytical Procedures Manual (MARLAP, 402-B-04-001A, July 2004). In addition, the Tetra Tech document "Review of Data Packages from Subcontracted Laboratories" (February 2002) was used along with other criteria specified in the applicable methods.

The review was intended to identify problems and quality control (QC) deficiencies that were readily apparent from the summary data package. The following sections discuss any problems or deficiencies that were found, and data qualifications applied because of non-compliant QC. The data review was limited to the available field and laboratory QC information submitted with the project specific data package.

I, Jessica A. Vickers, certify that all data validation criteria outlined in the above referenced documents were assessed, and any qualifications made to the data were in accordance with those documents.

#### DATA VALIDATION QUALIFIERS

- U** — The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J** — The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- J+** — The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and may be biased high.
- J-** — The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and may be biased low.
- UJ** — The analyte was analyzed for, but was not detected above the reported sample quantitation limit, which is estimated.
- R** — The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

## DATA ASSESSMENT

Sample delivery group (SDG) 160-6783-1 included one hundred twelve (112) environmental solid samples collected on May 21 through 23, 2014. The samples were analyzed for radioactive isotopes of uranium and thorium using alpha spectroscopy (Method A-01-R) and radioactive isotopes using gamma spectroscopy (Method GA-01-R) following the Department of Energy's Environmental Measurements Laboratory (EML) Procedures Manual HASL-300. The following summarizes the data validation that was performed.

### RADIOLOGICAL ANALYSIS

#### I. Holding Time and Chain of Custody (COC) Requirements

All samples were received by the laboratory and analyzed within the customary holding time of 6 months from sample collection to analysis. No data were qualified.

#### II. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses are not used with radiological analyses. The laboratory duplicate and LCS results provided adequate data on precision and accuracy. No data were qualified.

#### III. Blanks

Measurable detections of thorium-230, thorium-232, uranium-238, and/or lead-214 were detected in at least one of the method blanks associated with this SDG. The NFGs state that results below the blank value should be considered non-detectable (flagged "U") at the MDC, and that results above the blank concentration but less than 10 times the value should be flagged "J+". Thus, the following data were qualified:

- The lead-212 results (by gamma spectroscopy) for these samples were qualified as estimated with a possible high bias (flagged "J+"):

BMAC-SOIL-11	BMAC-OUTFALL-14	BMAC-OUTFALL-18
BMAC-OUTFALL-7	BMAC-OUTFALL-16	
BMAC-OUTFALL-8	BMAC-OUTFALL-17	

- The thorium-230 (by isotopic thorium analysis) results for these samples were qualified as estimated with a possible high bias (flagged "J+"):

BMAC-GRASS-1	BMAC-GRASS-19	BMAC-SOIL-14
BMAC-GRASS-2	BMAC-GRASS-20	BMAC-SOIL-15
BMAC-GRASS-3	BMAC-GRASS-23	BMAC-SOIL-16
BMAC-GRASS-6	BMAC-GRASS-27	BMAC-SOIL-17
BMAC-GRASS-8	BMAC-GRASS-29	BMAC-SOIL-18
BMAC-GRASS-9	BMAC-SOIL-1	BMAC-SOIL-19
BMAC-GRASS-11	BMAC-SOIL-2	BMAC-SOIL-20
BMAC-GRASS-12	BMAC-SOIL-3	BMAC-SOIL-21
BMAC-GRASS-13	BMAC-SOIL-7	BMAC-SOIL-22
BMAC-GRASS-14	BMAC-SOIL-9	BMAC-SOIL-23

BMAC-GRASS-15  
BMAC-GRASS-16  
BMAC-GRASS-17  
BMAC-GRASS-18

BMAC-SOIL-10  
BMAC-SOIL-11  
BMAC-SOIL-12  
BMAC-SOIL-13

BMAC-SOIL-26  
BMAC-SOIL-27

- The uranium-238 results (by alpha spectroscopy) for these samples were qualified as estimated with a possible high bias (flagged “J+”):

BMAC-DISCRETE-5  
BMAC-DISCRETE-7

BMAC-DISCRETE-8  
BMAC-DISCRETE-9

KOCH-SOIL-1  
KOCH-SOIL-2

- In addition, the thorium-230 (by isotopic thorium analysis) results for these samples were qualified as non-detect (flagged “U”).

BMAC-SOIL-24                    BMAC-SOIL-25

#### IV. Laboratory Control Sample (LCS)

Percent recoveries for the LCS analyses were within established control limits. No data were qualified.

#### V. Comments

Most laboratory duplicate results were well within their quality control limits for relative error ratio (RER). The exceptions were related to the gamma spectroscopy analyses of bismuth-212 for sample BMAC-GRASS-21 and actinium-227, actinium-228, radium-228, and thorium-232 for sample BMAC-OUTFALL-6, which all had RERs greater than 1. Therefore, the associated results were qualified as estimated (flagged “J”).

#### VI. Overall Assessment of Data

Overall data quality is acceptable, with no unusual qualifications added. All data are usable as qualified for their intended purposes.

**OPERATIONAL HISTORY: (How was the site identified?)** On May 5, 2014, the Tetra Tech, Inc. (Tetra Tech) Superfund Technical Assessment and Response Team (START) was tasked by the U.S. Environmental Protection Agency (EPA) Region 7 Superfund Division to assist with a Pre-Comprehensive Environmental Response, Compensation, and Liability Information System (Pre-CERCLIS) Screening at the Bridgeton Municipal Athletic Complex (BMAC) in Bridgeton, Missouri. The Pre-CERCLIS Screening was conducted to determine if further Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) response would be warranted. The screening activity was in response to a request by the Missouri Attorney General to the EPA Regional Administrator after a community group conducted field screening of soil at BMAC and reported detection of elevated radiation readings.

**IV. PRE-CERCLIS SCREENING ASSESSMENT CHECKLIST/DECISIONS**

(Criteria from "Improving Site Assessment: Pre-CERCLIS Screening Assessments," OSWER Directive #9375.2-11FS, EPA-540-F-98-039, PB98-963310, October 1999)

- 1. Does the site already appear in CERCLIS?** YES  or NO   
*(If YES, this form may be inappropriate to document site decisions, i.e., a CERCLA PA (at a minimum) is required.)*

*(If YES, then explain in Section V.)*
- 3. Does the site consist of a release of a naturally occurring substance in its unaltered form, or solely through naturally occurring processes or phenomena, from a location where it is naturally found?** YES  or NO   
*(If YES, then explain in Section V.)*
- 4. Is the release into a public or private drinking water supply due to deterioration of the system through ordinary use?** YES  or NO

**COMMENT:** The Pre-CERCLIS Screening of BMAC included a gross gamma survey of exterior surfaces at BMAC and reference areas along with collection of soil samples for laboratory analysis. The gross gamma survey of exterior ground surfaces at BMAC included collection of 58,716 data points across three surface types (grass-covered areas, exposed soil areas, and improved surfaces). No survey data acquired within BMAC were above twice the mean, a level at which EPA Region 7 typically conducts further investigation. In addition, geographic plots of the data reveal natural differences in gamma activity exhibited by different soil types, or surface materials. No unusual patterns of concentrated discrete areas of elevated gross gamma activity were observed. In addition to surveying exterior ground surfaces, 112 soil samples were collected and analyzed for isotopic uranium, isotopic thorium, radium-226, and other naturally occurring radionuclides. Reference area data were used to calculate a background threshold value (BTV) for each isotope. BMAC analytical data exceeding the BTV was then compared to risk-based standards. To account for naturally occurring radioactive material (NORM), the mean reference area value was subtracted from values exceeding the BTV. Radionuclide concentrations in excess of their BTV were compared with the selected risk-based standards to determine if further data review or investigation was warranted. Two risk-based standards were used for comparison to BMAC analytical data: the EPA total exposure preliminary remediation goals (PRG) for radionuclides in residential soil at a 1 in 10,000 lifetime cancer risk to an individual and the Formerly Utilized Sites Remedial Action Plan (FUSRAP) remediation goals (RG). None of the sample values exceed the PRGs or FUSRAP RGs. Results from the Pre-CERCLIS Screening do not indicate need for further CERCLA assessment at the BMAC site.

**REMOVAL ACTION RECOMMENDED:**  EMERGENCY  TIME-CRITICAL  NON-TIME-CRITICAL
